

Project 3: TalentBridge

CONSOLE is scaling fastly, but our hiring process is lagging behind. Top-tier talent is slipping through the cracks because our data is scattered across external testing sites, messy email threads, and rigid search filters.

Goal:

Your goal is to develop a **web application** that contains features solving the below mentioned problems faced by us due to the lack of such a centralized recruitment system.

The 4-Stage Solution

Stage 1: The Functional Core

Goal: Make a functional website containing a secure, end-to-end recruitment pipeline.

- **The Dual-Sided Portal:** Build a specialized interface for both Recruiters and Candidates. Here both can search each other by keyword and filter based searching. *#needed to write that use a third party apis/link for oa/interview and that result must be updated on the profile of the candidate???*
- **Direct Sync Messaging:** An in-built communication hub for real-time updates.
- **The Audit Trail:** Every status change (Applied → Interviewing → Offered) must be logged to prevent "The Concurrency Collision".

Stage 2: The Smart Matcher

Goal: Solve the "Keyword Trap" with AI-driven discovery.

- **Hybrid Search Engine:** Move *beyond basic SQL filters*. Integrate a Semantic Layer (RAG) that understands the *intent* of a job description. *Look up "Semantic Searching " to see how this works!*
- **Contextual Ranking:** The system should rank candidates based on how their actual experience aligns with the role, even if their resume uses different phrasing than the job post.

Stage 3: The Extraordinary Features

Goal: Add few features easing the most important and time consuming tasks.

- **Automation in Messaging and Reminders in Calendar:** When a recruiter assigns an Online Assessment (OA) or an interview link, the system sends automated reminders and syncs the deadline directly to the candidate's personal calendar.
- **Resume → Custom Profile:** A feature which automatically converts your resume into a custom profile which will help recruiters to easily identify the best candidate.

- **Offer Letter Generator:** Automatically generate secure, legal-ready PDFs for offers.
- **Auto Closure:** The job position closes once the offer letter is accepted by the candidate

Bonus Stage: The Profile Vault (Integrated OA)

Goal: Eliminate third-party dependencies and "Evaluation Black-Holes."

- **The Coding Sandbox:** Develop an integrated IDE (You may integrate third party IDE provider) and Quiz Engine within the platform. Candidates take technical tests directly in their profile.
- **Live-Monitoring Layer:** Create a "Proctor" feature that tracks tab-switching and allows recruiters to watch code being written in real-time.
- **Instant Grading:** Upon submission, the system must auto-grade the test and instantly update the candidate's status in the "Live Scoreboard."
- *For reference you can explore platforms like [CoderPad](#), CoderPad majorly focus on interviews and OA related things so for that part you can refer to it.*
- ****** // Can add a webscraping kind of thing where a models can automatically go to their LINKDIN profile and see candidates activities and find out info about him/her and judge based on the analyses.//***** YESS YESS!!*
